PLAINTIFF'S COMPLAINT FOR PATENT INFRINGEMENT

Plaintiff Unification Technologies LLC files this Complaint against Defendant Silicon Motion, Inc. for infringement of U.S. Patent No. 9,575,902 (the "'902 Patent"), U.S. Patent No. 11,061,825, (the "'825 Patent"), U.S. Patent No. 11,573,909 (the "'909 Patent"), and U.S. Patent No. 11,640,359 (the "'359 Patent"), and collectively, the "Asserted Patents."

THE PARTIES

1.   Plaintiff Unification Technologies LLC ("UTL") is a Texas Limited Liability Company with its principal place of business at 6136 Frisco Square Boulevard, Suite 400, Frisco, Texas 75034.

2.   On information and belief, Silicon Motion Inc. ("SMI") is a corporation organized and existing under the laws of Taiwan with its principal place of business located at 8/F, No. 36, Taiyuan Street, Zhubei City, Hsinchu County, 302082, Taiwan. SMI is a leading manufacturer, designer and seller of semiconductors, microcontrollers, and SoC products in the United States and the world, generally. SMI conducts business in Texas and, particularly, the Eastern District of

1

Texas, directly or through intermediaries (including subsidiaries, distributors, affiliates, retailers, suppliers, integrators, customers, or others).

3.   According to SMI's website, SMI "is the global leader in developing NAND flash controllers for SSDs and other solid state storage devices" and are "the world's leading supplier of SSD controllers used in PCs and other client devices and leading merchant supplier of eMMC/UFS controllers used in smartphones and IoT devices." https://www.siliconmotion.com/company/overview.

4.   SMI's website also state that it "was founded in 1995 in San Jose, California and now operate from corporate offices in Hong Kong, Taiwan, and the **US**." *Id*. (emphasis added).

JURISDICTION AND VENUE

5.   This is an action for patent infringement arising under the patent laws of the United States, 35 U.S.C. §§ 1, *et seq*. This Court has jurisdiction over this action pursuant to 28 U.S.C. §§ 1331 and 1338(a) and 1367.

6.   This Court has specific and personal jurisdiction over SMI consistent with the requirements of the Due Process Clause of the United States Constitution and the Texas Long Arm Statute (*see* Tex. Civ. Prac. & Rem. Code §§17.041 *et seq*.) because, among other things, (i) SMI has done and continues to do business in Texas, and (ii) SMI has committed and continues to commit, directly or through intermediaries (including subsidiaries, distributors, affiliates, retailers, suppliers, integrators, customers, and others), acts of patent infringement in this State and this District. Such acts of infringement include making, using, offering to sell, and/or selling Accused Products (as more particularly identified and described throughout this Complaint) in this State and this District and/or importing Accused Products into this State and/or inducing others to commit acts of patent infringement in this State. Indeed, SMI has purposefully and voluntarily

placed, and is continuing to place, one or more Accused Products into the stream of commerce through established distribution channels (including the Internet) with the expectation and intent that such products will be sold to and purchased by consumers in the United States, this State, and this District; and with the knowledge and expectation that such products (whether in standalone form or as integrated in downstream products) will be imported into the United States, this State, and this District.

7.   SMI has derived substantial revenues from its infringing acts occurring within this State and this District. It has substantial business in this State and this District, including: (i) at least part of its infringing activities alleged herein; and (ii) regularly doing or soliciting business, engaging in other persistent conduct, and/or deriving substantial revenue from infringing goods offered for sale, sold, and imported, and services provided to Texas residents vicariously through and/or in concert with its alter egos, intermediaries, agents, distributors, importers, customers, subsidiaries, and/or consumers.

8.   SMI is engaged in making, using, selling, offering for sale, and/or importing products, such as SSD controllers used in PCs and other electronic devices and eMMC/UFS controllers used in smartphones and IoT devices, to and throughout the United States, including this District. SMI also induces its subsidiaries, distributors, affiliates, retailers, suppliers, integrators, and customers in the making, using, selling, offering for sale, and/or importing such products to and throughout the United States, including this District. To this end, SMI and its foreign and U.S.-based subsidiaries—which act together as part of SMI's global network of sales and manufacturing emissaries—have operated as agents of and for one another and have otherwise acted vicariously for SMI as elements of the same business group and/or enterprise. Indeed, they work in concert and in orchestrated fashion, subject to agreements that are far nearer than arm's

3

length, in order to implement a distribution channel of infringing products within this District and the United States.

9.   SMI maintains a substantial corporate presence in the United States via at least its U.S.-based affiliate and customers. SMI's 2022 Annual Report identifies its parent corporation, Silicon Motion Technology Corporation ("SMTC") and also identifies Silicon Motion, Inc. ("SMI – USA") a wholly-owned US subsidiary that is a registered US Corporation located in the United States. Silicon Motion 2022 Form 20-F, https://siliconmotiontechnologycorporation.gcs-web.com/static-files/973eef9c-5b26-431b-ad6c-ae20b311ba42 at 25.

10.   SMI's 2022 Annual Report states that "[t]he address of our United States operating subsidiary. Silicon Motion, Inc., is 825 N. McCarthy Blvd., Suite 200, Milpitas, CA 95035." *Id*. SMI "acquir[ed] in August 2002 Silicon Motion, Inc., a California corporation [] which was incorporated in November 1995." *Id*.

11.   Thus, SMI – USA is a corporation organized under the laws of the State of California and is a wholly-owned subsidiary of SMTC.

12.   Moreover, according to SMI's website that is shares with SMI – USA and SMTC, "[o]n May 5, 2022, [SMTC] entered into an agreement and Plan of Merger [] with MaxLinear, Inc., a Delaware Corporation ("MaxLinear")…" *Id* at 1. Thus, on information and belief, SMTC and its SMI subsidiary do a significant amount of business in the United States through its affiliates SMI – USA and MaxLinear.

13.   Alone and through at least the activities of its U.S.-based affiliates and subsidiaries (e.g., SMI – USA and MaxLinear), SMI conducts business in the United States and this District, including importing, distributing, and selling controllers that are incorporated into devices, systems, and processes that infringe the Asserted Patents. *See Trois v. Apple Tree Auction Center,*

Inc., 882 F.3d 485, 490 (5th Cir. 2018) ("A defendant may be subject to personal jurisdiction because of the activities of its agent within the forum state…."); *see also Cephalon, Inc. v. Watson Pharmaceuticals, Inc.*, 629 F. Supp. 2d 338, 348 (D. Del. 2009) ("The agency theory may be applied not only to parents and subsidiaries, but also to companies that are 'two arms of the same business group,' operate in concert with each other, and enter into agreements with each other that are nearer than arm's length.").

14.   Through importation, offers to sell, sales, distributions, and related agreements to transfer ownership of SMI's products (e.g., controllers) with distributors and customers operating in and maintaining significant business presences in the United States, SMI conducts extensive business in the United States, this State, and this District.

15.   This Court has personal jurisdiction over SMI, directly or through intermediaries (e.g., subsidiaries, distributors, affiliates, retailers, suppliers, integrators, customers, and others), including its U.S.-based affiliates and subsidiaries, *e.g.*, SMI – USA and MaxLinear. Through direction and control of such affiliates and subsidiaries, SMI has committed acts of direct and/or indirect patent infringement within this State and elsewhere within the United States giving rise to this action and/or has established minimum contacts with this forum such that the exercise of personal jurisdiction over SMI would not offend traditional notions of fair play and substantial justice. SMI - USA is a wholly-owned affiliates of SMI and MaxLinear is a US-based affiliate that recently merged with parent SMTC. On information and belief, the primary business of SMI – USA and MaxLinear is the research, development, support, and/or sale of SMI's and SMTC's electronic products in the United States. As such, SMI has a direct financial interest in its U.S.-based subsidiaries and affiliates, and vice versa.

16.   On information and belief, SMI controls and otherwise directs and authorizes activities of its U.S.-based subsidiary SMI - USA. Such directed and authorized activities include, the U.S.-based subsidiaries using, offering for sale, selling, and/or importing the Accused Products, their components, and/or products containing the same that incorporate and/or perform the fundamental technologies covered by the Asserted Patents. SMI's U.S.-based subsidiary is expressly authorized to import, distribute, offer to sell, and sell the Accused Products on behalf of SMI. For example, on information and belief, SMI researches, designs, develops, and manufactures controllers, and then directs its U.S.-based subsidiary to import, distribute, offer for sale, and sell the Accused Products in the United States. *See, e.g., United States v. Hui Hsiung*, 778 F.3d 738, 743 (9th Cir. 2015) (finding that the sale of infringing products to third parties rather than for direct import into the U.S. did not "place [defendants'] conduct beyond the reach of United States law [or] escape culpability under the rubric of extraterritoriality"). SMI's U.S.-based subsidiary also provides, on SMI's behalf, marketing and technical support services for the Accused Products from their facilities in the United States.

17.   According to SMI's February 2023 Company Profile, SMI's "Worldwide Top Tier Customers & Market Play" includes dozens of US-based clients that incorporate SMI's controllers into their products such as Micron, Dell, Western Digital, Microsoft, Tesla, Amazon, HP, Xbox, and   Apple.   https://www.siliconmotion.com/download/3k1/a/SMI_company_profile_ 2021111.pdf at 9 and 13.

18.   On information and belief, because SMI's U.S.-based subsidiary and/or its affiliate MaxLinear are authorized by SMI to import, distribute, offer to sell, and sell Accused Products and/or to perform the fundamental technologies covered by the Asserted Patents, SMI's U.S.-based subsidiary and MaxLinear's corporate presences in the United States give SMI substantially the

same business advantages it would enjoy if it conducted its business through its own offices and personnel.

19.   In addition, SMI has knowingly induced, and continues to knowingly induce, infringement within this District by advertising, marketing, offering for sale and/or selling Accused Products (such as controllers) that incorporate the fundamental technologies covered by the Asserted Patents. Such advertising, marketing, offering for sale and/or selling of Accused Products is directed to manufacturers, integrators, suppliers, distributors, resellers, partners, consumers, customers, and/or end users, and this includes providing instructions, user manuals, advertising, and/or marketing materials facilitating, directing and encouraging use of infringing functionality with SMI's knowledge thereof.

20.   Using established channels and chains of distribution, SMI provides Accused Products to be used as components in a variety of end-products that are made, used, sold, and imported into the United States and this District. SMI knew or should have known that by purposefully placing the Accused Products into the stream of commerce, those Accused Products would be sold and used in the United States and this District.

21.   On information and belief, SMI and/or its agents provide the Accused Products for use in the United States. Indeed, Silicon Motion's Annual Report acknowledges revenue from the United States and notes that it maintains direct sales personnel in the United States. Silicon Motion 2022 Form 20-F, https://siliconmotiontechnologycorporation.gcs-web.com/static-files/973eef9c-5b26-431b-ad6c-ae20b311ba42 at 23, 27.

22.   Additionally, SMI provides Accused Products to be used as components in many end-products sold, used, and imported into the United States and this District. For example, SMI states in its March 2023 Company Profile that "All NAND Makers adopt SMI SSD controllers for

PC OEM SSD" including Kioxia, Micron, Samsung, SK Hynix, Solidigm, and Western Digital

which are incorporated in end products from PC OEMs such as HP, Dell, Lenovo, Asus, and Acer.

https://www.siliconmotion.com/download/3k1/a/SMI_company_profile__2021111.pdf at   12.

These PC OEMs sell, use, or import various end-products in the United States and this District that

use the Accused Products as components.

        23.   Upon information and belief, several large retailers with locations throughout the

United States and in this District, currently sell and have sold the products from the PC OEMs

containing the infringing SSD controllers to customers in the United States and in this District,

directly and through retailers such as Best Buy and Walmart.

        24.   Upon information and belief, SMI encourages and instructs users of SMI's Accused

Products in an infringing manner.

        25.   SMI has, thus, in the multitude of ways described above, availed itself of the

benefits and privileges of conducting business in the United States and this District and willingly

subjected itself to the exercise of this Court's personal jurisdiction. Indeed, SMI has sufficient

minimum contacts with this forum through its transaction of substantial business in this State and

this District and its commission of acts of patent infringement as alleged in this Complaint that are

purposefully directed towards this State and District.

        26.   Alternatively, the Court maintains personal jurisdiction over SMI under Federal

Rule of Civil Procedure 4(k)(2).

        27.   Venue is proper in this District pursuant to 28 U.S.C. § 1391 because, among other

things, SMI is not a resident of the United States, and thus may be sued in any judicial district,

including this one, pursuant to 28 U.S.C. § 1391(c)(3). *See In re HTC Corp.*, 889 F.3d 1349, 1357

(Fed. Cir. 2018) (holding that "[t]he Court's recent decision in *TC Heartland* does not alter" the alien-venue rule.).

THE PATENTS-IN-SUIT

28.   UTL is the sole and exclusive owner of all right, title, and interest in the '902 Patent, the '825 Patent, the '909 Patent, and the '359 Patent, and holds the exclusive right to take all actions necessary to enforce its rights in, and to, the Asserted Patents, including the filing of this patent infringement lawsuit. UTL also has the right to recover all damages for past, present, and future infringements of the Asserted Patents and to seek injunctive relief as appropriate under the law.

29.   The '902 Patent is titled, "Apparatus, system, and method for managing commands of solid-state storage using bank interleave." The '902 Patent lawfully issued on February 21, 2017, and stems from U.S. Patent Application No. 11/952,095, which was filed on December 6, 2007.

30.   The '825 Patent is titled, "Apparatus, system, and method for managing commands of solid-state storage using bank interleave." The '825 Patent lawfully issued on July 13, 2021, and stems from U.S. Patent Application No. 15/402,936, which was filed on January 10, 2017.

31.   The '909 Patent is titled, "Apparatus, system, and method for managing commands of solid-state storage using bank interleave." The '909 Patent lawfully issued on February 7, 2023, and stems from U.S. Patent Application No. 17/343,116, which was filed on June 9, 2021.

32.   The '359 Patent is titled, "Systems and methods for identifying storage resources that are not in use." The '359 Patent lawfully issued on May 2, 2023, and stems from U.S. Patent Application No. 16/543,464, which was filed on August 16, 2019.

33.   UTL and its predecessors complied with the requirements of 35 U.S.C. § 287, to the extent necessary, such that UTL may recover pre-suit damages.

34.   The claims of the patents-in-suit are directed to patent eligible subject matter under 35 U.S.C. § 101. They are not directed to an abstract idea, and the technologies covered by the claims comprise systems and/or consist of ordered combinations of features and functions that, at the time of invention, were not, alone or in combination, well-understood, routine, or conventional.

DEFENDANT'S PRE-SUIT KNOWLEDGE OF ITS INFRINGEMENT

35.   UTL sent a letter to SMI prior to filing this Complaint identifying the Asserted Patents as being infringed by exemplary SMI products, and further included claim charts demonstrating how the identified products infringe the Asserted Patents.

36.   The Accused Products addressed in the Counts below include, but are not limited to, the exemplary products identified in UTL's letter to SMI. SMI's past and continuing sales of the Accused Products (i) willfully infringe the Asserted Patents, and (ii) impermissibly usurp the significant benefits of UTL's patented technologies without fairly compensating UTL.

COUNT I
(INFRINGEMENT OF U.S. PATENT NO. 9,575,902)

37.   Plaintiff incorporates the preceding paragraphs herein by reference.

38.   This cause of action arises under the patent laws of the United States, and, in particular, 35 U.S.C. §§ 271, *et seq*.

39.   UTL is the owner of all substantial rights, title, and interest in and to the '902 Patent including the right to exclude others and to enforce, sue, and recover damages for past and future infringements.

40.   The '902 Patent is valid, enforceable, and was duly and legally issued by the United States Patent and Trademark Office on February 21, 2017, after full and fair examination.

41.   SMI has and continues to directly and/or indirectly infringe (by inducing infringement) one or more claims of the '902 Patent in this District and elsewhere in Texas and

the United States by making, using, selling, offering to sell, and/or importing, and by actively

inducing others to make, use, sell, offer to sell, and/or import, SMI products, their components and

processes, and/or products containing the same that incorporate the fundamental technologies

covered by the '902 Patent, including, but not limited to, the SMI SSD Controllers, including

SMI's Client, Enterprise, and Automotive SSD Controllers and FerriSSDs, such as for example

the SM2268XT and PCIe Gen4/NVMe Single Chip SSD Bx Series (collectively, the "'902

Accused Products").
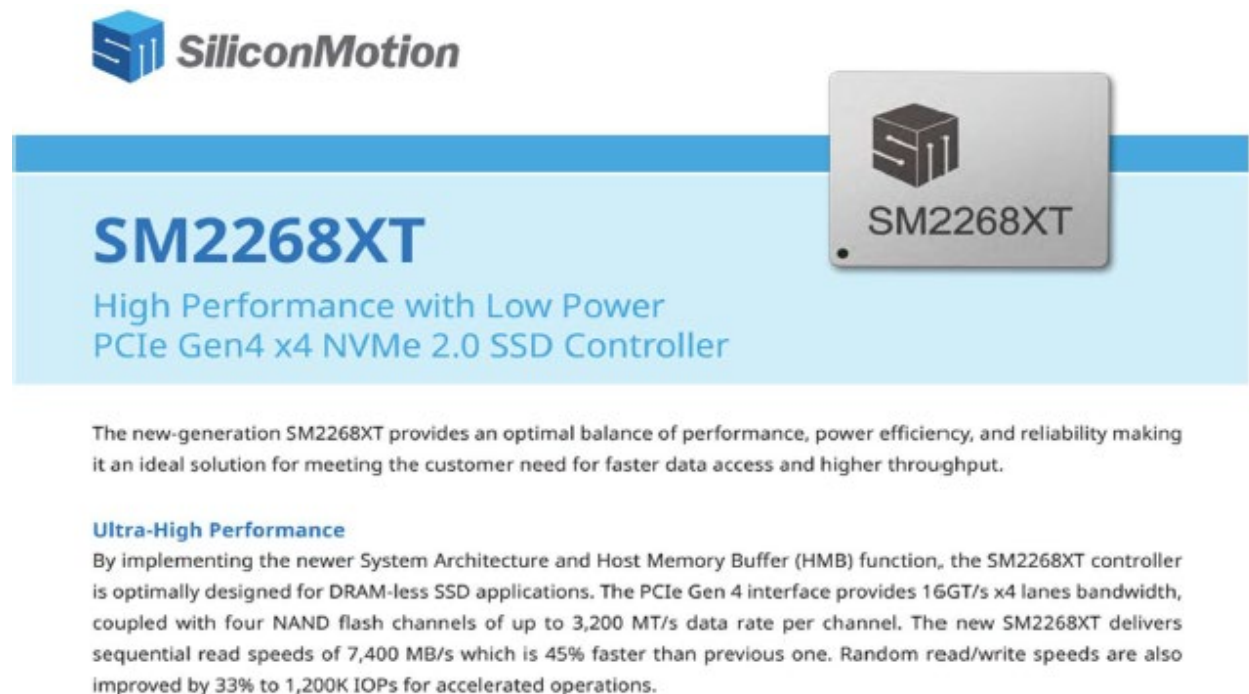

Direct Infringement (35 U.S.C. § 271(a))

42.   SMI has directly infringed and continues to directly infringe one or more claims of

the'902 Patent in this District and elsewhere in Texas and the United States.

43.   SMI has directly infringed and continues to directly infringe, either by itself or via

its agent(s), at least Claim 1 of the '902 Patent[1] as set forth under 35 U.S.C. § 271(a) by making,

offering for sale, selling, and/or importing the '902 Accused Products. Furthermore, SMI makes

and sells the '902 Accused Products outside of the United States and either delivers those products

to its customers, distributors, and/or subsidiaries in the United States, or, in the case that it delivers

the '902 Accused Products outside of the United States, it does so intending and/or knowing that

those products are destined for the United States and/or designed and designated for sale in the

United States, thereby directly infringing the '902 Patent. *See, e.g., Lake Cherokee Hard Drive*

Techs., L.L.C. v. Marvell Semiconductor, Inc., 964 F. Supp. 2d 653, 658 (E.D. Tex. 2013).

Furthermore, SMI directly infringes the '902 Patent through its direct involvements in, and control

---

[1] Throughout this Complaint, wherever UTL identifies specific claims of the Asserted Patents infringed by SMI, UTL expressly reserves the right to identify additional claims and products in its infringement contentions in accordance with applicable local rules and the Court's case management order. Specifically identified claims throughout this Complaint are provided for notice pleading only.

of, the activities of its subsidiaries and/or affiliates, including SMI – USA and MaxLinear. Subject

to SMI's direction and control, such subsidiaries and affiliates conduct activities that constitute

direct infringement of the '902 Patent under 35 U.S.C. § 271(a) by making, offering for sale,

selling, and/or importing '902 Accused Products. SMI receives direct financial benefit from such

infringements of its U.S.-based subsidiaries and/or affiliates, including SMI – USA and

MaxLinear.

44.   By way of illustration only, the '902 Accused Products perform each and every

element of claim 1 of the '902 Patent. As shown below, the '902 Accused Products perform a

method for controlling execution of storage commands on non-volatile solid-state storage in

accordance with the requirements of claim 1. Further, SMI directs or controls each step discussed

below by including instructions and directives, such as firmware and source code, in the Accused

Products that cause this to occur. For example, SMI's SM2268XT PCIe Gen 4x5 NVMe 2.0 SSD

controller performs such a method:

SM2268XT

High Performance with Low Power
PCIe Gen4 x4 NVMe 2.0 SSD Controller

The new-generation SM2268XT provides an optimal balance of performance, power efficiency, and reliability making it an ideal solution for meeting the customer need for faster data access and higher throughput.

Ultra-High Performance
By implementing the newer System Architecture and Host Memory Buffer (HMB) function, the SM2268XT controller is optimally designed for DRAM-less SSD applications. The PCIe Gen 4 interface provides 16GT/s x4 lanes bandwidth, coupled with four NAND flash channels of up to 3,200 MT/s data rate per channel. The new SM2268XT delivers sequential read speeds of 7,400 MB/s which is 45% faster than previous one. Random read/write speeds are also improved by 33% to 1,200K IOPs for accelerated operations.

"SM2268XT PCIe Gen 4 x5 NVMe 2.0 SSD Controller," Product Brief, Silicon Motion, Inc., 2023, https://www.siliconmotion.com/download/3oH/a/SM2268XT_PB_EN.pdf

45.   The '902 Accused Products comprise circuitry implementing a method to receive storage commands at respective command queues, each command queue associated with one of two or more banks of a non-volatile solid-state storage device, wherein the storage commands include storage commands of a first type received in an order at a first command queue associated with a first one of the banks and storage commands of a second, different type, received in an order at a second command queue associated with a second one of the banks. For example, the SM2268XT PCIe Gen4 x5 NVMe 2.0 SSD controller implements the NVM Express (NVMe) 2.0 interface that "allows host software to communicate with a non-volatile memory subsystem." *See* "NVM Express Revision 2.0 Base Specification," May 13, 2021, at 2.

SM2268XT

Host Interface	PCIe Gen4 x4
PCIe Protocol	NVMe 2.0
Processor	Dual-core ARM Cortex R8 CPU
NAND Flash Channel	4
Channel/CE	4CH/16CE
Max Performance	Sequential Read: 7,400 MB/s
	Sequential Write: 6,500 MB/s
	Random Read: 1,200K IOPS
	Random Write: 1,200K IOPS
NAND Flash Support	ONFI 5.0 and Toggle 3.0
	NV-DDR3/NV-LPDDR4 up to 3,200 MT/s
Security	Real time full drive encryption with AES 128/256
	TCG Opal 2.0 compliant
	Hardware SHA 384 and TRNG
	Secure Boot for FW authentication
Package	247-balls FCCSP (7.7mm x 11mm)

"SM2268XT PCIe Gen 4 x5 NVMe 2.0 SSD Controller," Product Brief, Silicon Motion, Inc., 2023, https://www.siliconmotion.com/download/3oH/a/SM2268XT_PB_EN.pdf

46.   Under the NVMe 2.0 interface, "the host software submits commands to the controller through pre-allocated Submission Queues."

> When using a memory-based transport implementation (e.g. PCIe), host software submits commands to a controller through pre-allocated Submission Queues. A controller is alerted to newly submitted commands through SQ Tail Doorbell register writes. The difference between the previous doorbell register value and the current register write indicates the number of commands that were submitted.
>
> A controller fetches commands from the Submission Queue(s) and processes them. Except for fused operations, there are no ordering restrictions for processing of commands within or across Submission Queues. Host software should not submit commands to a Submission Queue that may not be re-ordered arbitrarily. Data associated with the processing of a command may or may not be committed to the NVM subsystem non-volatile memory storage medium in the order that commands are submitted.

"NVM Express Revision 2.0 Base Specification," May 13, 2021, at 31.

47.   The NVMe 2.0 interface provides that there are Submission Queues in the Controller Memory Buffer that allows the host to write the entire submission queue entry (command) to the controller's internal memory space thus avoiding one read from the controller to the host.

> Submission Queues in host memory require the controller to perform a PCI Express read from host memory in order to fetch the submission queue entries. Submission Queues in controller memory enable host software to directly write the entire submission queue entry to the controller's internal memory space, avoiding one read from the controller to the host. This approach reduces latency in command execution and improves efficiency in a PCI Express fabric topology that may include multiple switches. Similarly, PRP Lists or SGLs require separate fetches across the PCI Express fabric, which may be avoided by writing the PRP or SGL to the Controller Memory Buffer. Completion Queues in the Controller Memory Buffer may be used for peer to peer or other applications. For writes of small amounts of data, it may be advantageous to have the host write the data and/or metadata to the Controller Memory Buffer rather than have the controller fetch it from host memory.

"NVM Express Revision 2.0 Base Specification," May 13, 2021, at 350.

48.   The submission queues in the Controller Memory Buffer include at least I/O Submission Queue and Admin Submission Queues. See, e.g., *id.* at 6 (1.51 Admin Queue); *id.* at 8 (1.5.14 Controller ". . . All controllers implement one Admin Submission Queue and one Admin Completion Queue. Depending on the controller type, a controller may also implement one or more I/O Submission Queues and I/O Completion Queues."); *id.* at 9 (1.5.33 I/O Submission Queue).

Figure 160: Create I/O Submission Queue – Command Dword 11

Bits	Description
00	**Physically Contiguous (PC):** If set to '1', then the Submission Queue is physically contiguous and PRP Entry 1 (PRP1) is the address of a contiguous physical buffer. If cleared to '0', then the Submission Queue is not physically contiguous and PRP Entry 1 (PRP1) is a PRP List pointer. If this bit is cleared to '0' and CAP.CQR is set to '1', then the controller should return an error of Invalid Field in Command. If the: • queue is located in the Controller Memory Buffer; • PC is cleared to '0'; and • CMBLOC.CQPDS is cleared to '0', then the controller shall abort the command with Invalid Use of Controller Memory Buffer status.

"NVM Express Revision 2.0 Base Specification," May 13, 2021, at 158.

Support for Sanitize commands in a Controller Memory Buffer (i.e., submitted to an Admin Submission Queue in a Controller Memory Buffer or specifying an Admin Completion Queue in a Controller Memory Buffer) is implementation specific. If an implementation does not support Sanitize commands in a Controller Memory Buffer and a controller's Admin Submission Queue or Admin Completion Queue is in the Controller Memory Buffer, then the controller shall abort all Sanitize commands with a status code of Command Not Supported for Queue in CMB.

"NVM Express Revision 2.0 Base Specification," May 13, 2021, at 283.

49.   The NVMe 2.0 interface defines a namespace as a formatted quantity of non-volatile memory accessible by a host. A namespace is also associated with an I/O Command Set that operates on that namespace. The NVMe 2.0 interface provides the common command format of the NVMe 2.0 interface includes a namespace identifier (NSID) which specifies the namespace that the command applies to. The NVMe 2.0 interface additionally defines a command as being processed when "the controller and/or namespace state is being accessed or modified by the command." *Id*. at 106.

A namespace is a formatted quantity of non-volatile memory that may be accessed by a host. Associated with each namespace is an I/O Command Set that operates on that namespace. An NVM Express controller may support multiple namespaces that are referenced using a namespace ID. Namespaces may be created and deleted using the Namespace Management and Capacity Management commands. The Identify Namespace data structure, the I/O Command Set specific Identify Namespace data structure, and the I/O Command Set Independent Identify Namespace data structure indicate capabilities and settings that are specific to a particular namespace.

"NVM Express Revision 2.0 Base Specification," May 13, 2021, at 16.

15

Figure 87: Common Command Format

Bytes	Description
03:00	**Command Dword 0 (CDW0):** This field is common to all commands and is defined in Figure 86.
07:04	**Namespace Identifier (NSID):** This field specifies the namespace that this command applies to. If the namespace identifier is not used for the command, then this field shall be cleared to 0h. The value FFFFFFFFh in this field is a broadcast value (refer to section 3.2.1.2), where the scope (e.g., the NVM subsystem, all attached namespaces, or all namespaces in the NVM subsystem) is dependent on the command. Refer to Figure 138 and Figure 390 for commands that support the use of the value FFFFFFFFh in this field. Specifying an inactive namespace identifier (refer to section 3.2.1.4) in a command that uses the namespace identifier shall cause the controller to abort the command with a status code of Invalid Field in Command, unless otherwise specified. Specifying an invalid namespace identifier (refer to section 3.2.1.2) in a command that uses the namespace identifier shall cause the controller to abort the command with a status code of Invalid Namespace or Format, unless otherwise specified. If the namespace identifier is used for the command (refer to Figure 138), the value FFFFFFFFh is not supported for that command, and the host specifies a value of FFFFFFFFh, then the controller should abort the command with a status code of Invalid Field in Command, unless otherwise specified. If the namespace identifier is not used for the command and the host specifies a value from 1h to FFFFFFFFh, then the controller should abort the command with a status code of Invalid Field in Command, unless otherwise specified.
11:08	**Command Dword 2 (CDW2):** This field is command specific Dword2.
15:12	**Command Dword 3 (CDW3):** This field is command specific Dword3.

"NVM Express Revision 2.0 Base Specification," May 13, 2021, at 92.

50.   The NVMe 2.0 interface also supports launching and executing multiple commands from a submission queue in parallel by configuring an Arbitration Burst. "Arbitration burst" is defined as "[t]he maximum number of commands that may be fetched by an arbitration mechanism at one time from a Submission Queue." *Id*. at 7 (1.5.3 arbitration burst).

In order to make efficient use of the non-volatile memory, it is often advantageous to execute multiple commands from a Submission Queue in parallel. For Submission Queues that are using weighted round robin with urgent priority class or round robin arbitration, host software may configure an Arbitration Burst setting. The Arbitration Burst setting indicates the maximum number of commands that the controller may launch at one time from a particular Submission Queue. It is recommended that host software configure the Arbitration Burst setting as close to the recommended value by the controller as possible (specified in the Recommended Arbitration Burst field of the Identify Controller data structure in Figure 275), taking into consideration any latency requirements. Refer to section 5.27.1.1.

"NVM Express Revision 2.0 Base Specification," May 13, 2021, at 106.

51.   As another example of the '902 Accused Products comprising circuitry implementing the method of claim 1, for example, the SM2268XT PCIe Gen4 x5 NVMe 2.0 SSD controller implements the Open NAND Flash Interface (ONFI) 5.0 standardized NAND Flash device interface.

SM2268XT

Host Interface	PCIe Gen4 x4
PCIe Protocol	NVMe 2.0
Processor	Dual-core ARM Cortex R8 CPU
NAND Flash Channel	4
Channel/CE	4CH/16CE
Max Performance	Sequential Read: 7,400 MB/s
	Sequential Write: 6,500 MB/s
	Random Read: 1,200K IOPS
	Random Write: 1,200K IOPS
NAND Flash Support	ONFI 5.0 and Toggle 3.0
	NV-DDR3/NV-LPDDR4 up to 3,200 MT/s
Security	Real time full drive encryption with AES 128/256
	TCG Opal 2.0 compliant
	Hardware SHA 384 and TRNG
	Secure Boot for FW authentication
Package	247-balls FCCSP (7.7mm x 11mm)

"SM2268XT PCIe Gen 4 x5 NVMe 2.0 SSD Controller," Product Brief, Silicon Motion, Inc., 2023, https://www.siliconmotion.com/download/3oH/a/ SM2268XT_PB_EN.pdf

52.   ONFI 5.0 NAND flash interface provides that only one Logical Unit (LUN), which is defined as the "minimum unit that can independently execute commands," can be selected for data output at any particular time. "Open NAND Flash Interface (ONFI) Specification, Revision 5.0," May 25, 2021, at 88.

3.1.2. Logical Unit Selection

Logical units that are part of a NAND Target share a single data bus with the host. The host shall ensure that only one LUN is selected for data output to the host at any particular point in time to avoid bus contention.

The host selects a LUN for future data output by issuing a Read Status Enhanced command to that LUN. The Read Status Enhanced command shall deselect the output path for all LUNs that are not addressed by the command. The page register selected for output within the LUN is determined by the previous Read (Cache) commands issued and is not impacted by Read Status Enhanced.

"Open NAND Flash Interface (ONFI) Specification, Revision 5.0," May 25, 2021, at 91.

53.   The '902 Accused Products, such as for example the SM2268XT PCIe Gen4 x5 NVMe 2.0 SSD controller, comprise circuitry implementing a method to issue commands from the first and second command queues such that execution of a first command of the first type overlaps in time with execution of a second command of the second type.

54.   For example, as noted above the SM2268XT PCIe Gen4 x5 NVMe 2.0 SSD controller implements NVMe 2.0 which supports launching and executing multiple commands from a submission queue in parallel by configuring an Arbitration Burst that sets a maximum number of commands that may be fetched "at one time" from a Submission queue, i.e. before fetching commands from another queue.

> In order to make efficient use of the non-volatile memory, it is often advantageous to execute multiple commands from a Submission Queue in parallel. For Submission Queues that are using weighted round robin with urgent priority class or round robin arbitration, host software may configure an Arbitration Burst setting. The Arbitration Burst setting indicates the maximum number of commands that the controller may launch at one time from a particular Submission Queue. It is recommended that host software configure the Arbitration Burst setting as close to the recommended value by the controller as possible (specified in the Recommended Arbitration Burst field of the Identify Controller data structure in Figure 275), taking into consideration any latency requirements. Refer to section 5.27.1.1.

"NVM Express Revision 2.0 Base Specification," May 13, 2021, at 106.

55.   As another example, as noted above the SM2268XT PCIe Gen4 x5 NVMe 2.0 SSD controller implements ONFI 5.0 NAND flash interface which provides that separate logical unit (LUNs) "may operate on arbitrary command sequences in parallel."

> A logical unit (LUN) is the minimum unit that can independently execute commands and report status. Specifically, separate LUNs may operate on arbitrary command sequences in parallel. For example, it is permissible to start a Page Program operation on LUN 0 and then prior to the operation's completion to start a Read command on LUN 1. See multiple LUN operation restrictions in section 3.1.3. A LUN contains at least one page register and a Flash array. The number of page registers is dependent on the number of multi-plane operations supported for that LUN. The Flash array contains a number of blocks.

"Open NAND Flash Interface (ONFI) Specification, Revision 5.0," May 25, 2021, at 88.

3.1.3. Multiple LUN Operation Restrictions

LUNs are independent entities. A multiple LUN operation is one in which two or more LUNs are simultaneously processing commands. During multiple LUN operations the individual LUNs involved may be in any combination of busy or ready status

When a Page Program command (80h) is issued on any LUN that is not preceded by an 11h command, all idle LUNs may clear their page registers if the program page register clear enhancement is not supported or enabled. Thus, the host should not begin a Page Program command on a LUN while a Read Page operation is either ongoing or has completed but the data has not been read from another LUN, as the contents of the page register for the Read operation are lost. A Read Page can be issued to one LUN while a Page Program is ongoing within a second LUN without any restriction. If the program page register clear enhancement is enabled, this restriction does not apply.

"Open NAND Flash Interface (ONFI) Specification, Revision 5.0," May 25, 2021, at 91.

56.   The '902 Accused Products, such as for example the SM2268XT PCIe Gen4 x5 NVMe 2.0 SSD controller, comprise circuitry implementing a method wherein an execution duration of the first command is at least an order of magnitude greater than an execution duration of the second command.

57.   On information and belief, the execution duration of at least some of the Admin Commands submitted for example through the Admin Submission Queue (see "NVM Express Revision 2.0 Base Specification," May 13, 2021, at Section 5) is at least an order of magnitude greater than an execution duration of an I/O command submitted for example to an I/O Submission Queue (see *id*. at Section 5). Additionally, the ONFI 5.0 NAND flash interface provides that tADL (used for Program operations) is an order of magnitude greater than tWHR (used for ReadID, Read Status, and Read Status Enhanced commands), and tWC (write cycle time):

Constant Timing Parameter Values

Table 4-77   NV-LPDDR4 Timing Parameter Values: Command and Address

"Open NAND Flash Interface (ONFI) Specification, Revision 5.0," May 25, 2021, at 188.

58.   The '902 Accused Products, such as for example the SM2268XT PCIe Gen4 x5 NVMe 2.0 SSD controller, comprise circuitry implementing a method to issue commands from the first command queue in an order different than the order in which the commands were received at the first command queue.

59.   For example, under the NVMe 2.0 interface, the controller can fetch commands in order from the Submission Queue but may execute those commands in any order:

> A Submission Queue (SQ) is a circular buffer with a fixed slot size that the host software uses to submit commands for execution by the controller. The host software updates the appropriate SQ Tail doorbell register when there are one to *n* new commands to execute. The previous SQ Tail value is overwritten in the controller when there is a new doorbell register write. The controller fetches SQ entries in order from the Submission Queue and may execute those commands in any order.

"NVM Express Revision 2.0 Base Specification," May 13, 2021, at 18.

> A candidate command is a submitted command which has been transferred into the controller that the controller deems ready for processing. The controller selects command(s) for processing from the pool of submitted commands for each Submission Queue. The commands that comprise a fused operation shall be processed together and in order by the controller. The controller may select candidate commands for processing in any order. The order in which commands are selected for processing does not imply the order in which commands are completed.

"NVM Express Revision 2.0 Base Specification," May 13, 2021, at 106.

Indirect Infringement (Inducement – 35 U.S.C. § 271(b))

60.   In addition and/or in the alternative to its direct infringements, SMI has indirectly infringed and continues to indirectly infringe one or more claims of the '902 Patent by knowingly and intentionally inducing others, including its subsidiaries, distributors, affiliates, retailers, suppliers, integrators, importers, customers, and/or consumers, to directly infringe by making, using, offering to sell, selling and/or importing into the United States the '902 Accused Products.

61.   At a minimum, SMI has knowledge of the '902 Patent since being served with this Complaint. SMI also has knowledge of the '902 Patent since receiving detailed correspondence from UTL prior to the filing of the Complaint, alerting SMI to its infringements. Since receiving notice of its infringements, SMI has actively induced the direct infringements of its subsidiaries,

distributors, affiliates, retailers, suppliers, integrators, importers, customers, and/or consumers as set forth under U.S.C. § 271(b). Such inducements have been committed with the knowledge, or with willful blindness to the fact, that the acts induced constitute infringement of the '902 Patent. Indeed, SMI has intended to cause, continues to intend to cause, and has taken, and continues to take affirmative steps to induce infringement by, among other things, creating and disseminating advertisements and instructive materials that promote the infringing use of the '902 Accused Products; creating and/or maintaining established distribution channels for the '902 Accused Products into and within the United States; manufacturing the '902 Accused Products in conformity with U.S. laws and regulations; providing technical documentation for the '902 Accused Products, including white papers, product briefs, and descriptions of the features and technologies [2]; promoting the incorporation of the '902 Accused Products into end-user products.

Damages

62.   On information and belief, despite having knowledge of the '902 Patent and knowledge that it is directly and/or indirectly infringing one or more claims of the '902 Patent, SMI has nevertheless continued its infringing conduct and disregarded an objectively high likelihood of infringement. SMI's infringing activities relative to the '902 Patent have been, and continue to be, willful, wanton, malicious, in bad-faith, deliberate, consciously wrongful, flagrant, characteristic of a pirate, and an egregious case of misconduct beyond typical infringement such that UTL is entitled to enhanced damages under 35 U.S.C. § 284 up to three times the amount found or assessed.

---

[2] *See, e.g.*, https://www.siliconmotion.com/products/client/detail; https://www.siliconmotion.com/products/enterprise/detail; https://www.siliconmotion.com/products/Portable/detail; https://www.siliconmotion.com/products/automotive/detail; https://www.siliconmotion.com/product/Ferri-Embedded-Storage.html; and the product briefs and white papers linked therefrom (last visited May 20, 2023).

63.   UTL has been damaged as a result of SMI's infringing conduct described in this Count. SMI is, thus, liable to UTL in an amount that adequately compensates UTL for SMI's infringements, which, by law, cannot be less than a reasonable royalty, together with interest and costs as fixed by this Court under 35 U.S.C. § 284.

COUNT II

(INFRINGEMENT OF U.S. PATENT NO. 11,061,825)

64.   Plaintiff incorporates the preceding paragraphs herein by reference.

65.   This cause of action arises under the patent laws of the United States, and, in particular, 35 U.S.C. §§ 271, *et seq*.

66.   UTL is the owner of all substantial rights, title, and interest in and to the '825 Patent including the right to exclude others and to enforce, sue, and recover damages for past and future infringements.

67.   The '825 Patent is valid, enforceable, and was duly and legally issued by the United States Patent and Trademark Office on July 13, 2021, after full and fair examination.

68.   SMI has and continues to directly and/or indirectly infringe (by inducing infringement) one or more claims of the '825 Patent in this District and elsewhere in Texas and the United States by making, using, selling, offering to sell, and/or importing, and by actively inducing others to make, use, sell, offer to sell, and/or import, SMI products, their components and processes, and/or products containing the same that incorporate the fundamental technologies covered by the '825 Patent, including, but not limited to, the SMI SSD Controllers, including SMI's Client, Enterprise, and Automotive SSD Controllers and FerriSSDs, such as for example the SM2268XT and PCIe Gen4/NVMe Single Chip SSD Bx Series (collectively, the "'825 Accused Products").
Direct Infringement (35 U.S.C. § 271(a))

69.   SMI has directly infringed and continues to directly infringe one or more claims of the '825 Patent in this District and elsewhere in Texas and the United States.

70.   SMI has directly infringed and continues to directly infringe, either by itself or via its agent(s), at least Claim 1 of the '825 Patent as set forth under 35 U.S.C. § 271(a) by making, offering for sale, selling, and/or importing, the '825 Accused Products. Furthermore, SMI makes and sells the '825 Accused Products outside of the United States and either, delivers those products to its customers, distributors, and/or subsidiaries in the United States, or, in the case that it delivers the '825 Accused Products outside of the United States, it does so intending and/or knowing that those products are destined for the United States and/or designed and designated for sale in the United States, thereby directly infringing the '825 Patent. *See, e.g., Lake Cherokee Hard Drive Techs., L.L.C. v. Marvell Semiconductor, Inc.*, 964 F. Supp. 2d 653, 658 (E.D. Tex. 2013). Furthermore, SMI directly infringes the '825 Patent through its direct involvements in, and control of, the activities of its subsidiaries and/or affiliates, including SMI – USA and MaxLinear. Subject to SMI's direction and control, such subsidiaries and/or affiliates conduct activities that constitute direct infringement of the '825 Patent under 35 U.S.C. § 271(a) by making, offering for sale, selling, and/or importing '825 Accused Products. SMI receives direct financial benefit from such infringements of its U.S.-based subsidiaries and affiliates, including SMI – USA and MaxLinear.

71.   By way of illustration only, the '825 Accused Products include each and every element of claim 1 of the '825 Patent. As shown below, the '825 Accused Products either comprise a system including a solid state storage device or are configured for inclusion in such a system. For example, Silicon Motion's FerriSSDs including, but not limited, PCIe Gen4/NVMe Single Chip SSD Bx Series (e.g., SM681GX*-Bx) are a system including a solid state storage device.

Additionally, the Accused Silicon Motion SSD controllers, including, but not limited to, SM2268XT PCIe Gen 4x5 NVMe 2.0 SSD controller are configured for inclusion in a system including a solid-state storage device.

"PICe Gen4/NVMe Single Chip SSD Bx Series Product Brief," Silicon Motion, Inc., 2023; https://www.siliconmotion.com/download/DWbY/a/PCIe_Gen4_NVMe_FerriSSD_PB_EN.pdf

"SM2268XT PCIe Gen 4 x5 NVMe 2.0 SSD Controller," Product Brief, Silicon Motion, Inc., 2023, https://www.siliconmotion.com/download/3oH/a/SM2268XT_PB_EN.pdf

72.   The '825 Accused Products comprise a first controller that directs at least one command to a plurality of queues, wherein the at least one command is separated into the plurality of queues based on a command type of each command of the at least one command, and the plurality of queues comprises a first queue configured to store management commands and a second queue configured to store other commands. For example, the SM681GX*-Bx and SM2268XT PCIe Gen4 x4 NVMe 2.0 SSD controller implement the NVM Express (NVMe) 2.0 interface that "allows host software to communicate with a non-volatile memory subsystem." *See* "NVM Express Revision 2.0 Base Specification," May 13, 2021, at 2.

Specifications

	SM681GX*-Bx
Host Interface	PCIe Gen4 x4 Lane
PCIe Protocal	NVMe 2.0 with NVMe MI Appendix C Specification
Density	120~960GB 3D TLC ; 32~320GB 3D SLCMode
HMB support	DRAM-less with optional HMB
Form Factor	20mm x 16mm BGA
Green Product	Compliant to RoHS (Restriction to Hazardous Substances Directive) 2.0 / Halogen Free
Temperature Support	Commercial (0°C to + 70°C) Industrial (-40°C to + 85°C) Automotive (-40°C to + 105°C)

	Secure Boot for FW authentication
Package	247-balls FCCSP (7.7mm x 11mm)

"SM2268XT PCIe Gen 4 x5 NVMe 2.0 SSD Controller," Product Brief, Silicon Motion, Inc., 2023, https://www.siliconmotion.com/download/3oH/a/SM2268XT_PB_EN.pdf

73.   The NVMe 2.0 interface provides that the host software submits commands to the controller which can be directed to one or more Submission Queues in the Controller Memory Buffer that allows the host to write the entire submission queue entry (command) to the controller's internal memory space thus avoiding one read from the controller to the host.

When using a memory-based transport implementation (e.g. PCIe), host software submits commands to a controller through pre-allocated Submission Queues. A controller is alerted to newly submitted commands through SQ Tail Doorbell register writes. The difference between the previous doorbell register value and the current register write indicates the number of commands that were submitted.

A controller fetches commands from the Submission Queue(s) and processes them. Except for fused operations, there are no ordering restrictions for processing of commands within or across Submission Queues. Host software should not submit commands to a Submission Queue that may not be re-ordered arbitrarily. Data associated with the processing of a command may or may not be committed to the NVM subsystem non-volatile memory storage medium in the order that commands are submitted.

"NVM Express Revision 2.0 Base Specification," May 13, 2021, at 31.

Submission Queues in host memory require the controller to perform a PCI Express read from host memory in order to fetch the submission queue entries. Submission Queues in controller memory enable host software to directly write the entire submission queue entry to the controller's internal memory space, avoiding one read from the controller to the host. This approach reduces latency in command execution and improves efficiency in a PCI Express fabric topology that may include multiple switches. Similarly, PRP Lists or SGLs require separate fetches across the PCI Express fabric, which may be avoided by writing the PRP or SGL to the Controller Memory Buffer. Completion Queues in the Controller Memory Buffer may be used for peer to peer or other applications. For writes of small amounts of data, it may be advantageous to have the host write the data and/or metadata to the Controller Memory Buffer rather than have the controller fetch it from host memory.

"NVM Express Revision 2.0 Base Specification," May 13, 2021, at 350.

74.   The submission queues in the Controller Memory Buffer include at least I/O Submission Queue (used to submit I/O commands such as Read and Write commands *id*. at 9) and Admin Submission Queues (used to submit administrative commands *id*. at 6); *see also id*. at 8 (1.5.14 Controller ". . . All controllers implement one Admin Submission Queue and one Admin Completion Queue. Depending on the controller type, a controller may also implement one or more I/O Submission Queues and I/O Completion Queues."); *id*. at 9 (1.5.33 I/O Submission Queue).

**Figure 160: Create I/O Submission Queue – Command Dword 11**

Bits	Description
00	**Physically Contiguous (PC):** If set to '1', then the Submission Queue is physically contiguous and PRP Entry 1 (PRP1) is the address of a contiguous physical buffer. If cleared to '0', then the Submission Queue is not physically contiguous and PRP Entry 1 (PRP1) is a PRP List pointer. If this bit is cleared to '0' and CAP.CQR is set to '1', then the controller should return an error of Invalid Field in Command. If the: • queue is located in the Controller Memory Buffer; • PC is cleared to '0'; and • CMBLOC.CQPDS is cleared to '0', then the controller shall abort the command with Invalid Use of Controller Memory Buffer status.

"NVM Express Revision 2.0 Base Specification," May 13, 2021, at 158.

Support for Sanitize commands in a Controller Memory Buffer (i.e., submitted to an Admin Submission Queue in a Controller Memory Buffer or specifying an Admin Completion Queue in a Controller Memory Buffer) is implementation specific. If an implementation does not support Sanitize commands in a Controller Memory Buffer and a controller's Admin Submission Queue or Admin Completion Queue is in the Controller Memory Buffer, then the controller shall abort all Sanitize commands with a status code of Command Not Supported for Queue in CMB.

"NVM Express Revision 2.0 Base Specification," May 13, 2021, at 283.

75.   The '825 Accused Products either comprise a solid-state storage device, such as for example the SM681GX*-Bx, or are configured for inclusion in a system including a solid-state storage device, such as for example the SM2268XT PCIe Gen4 x4 NVMe 2.0 SSD controller.

"PICe Gen4/NVMe Single Chip SSD Bx Series Product Brief," Silicon Motion, Inc., 2023; https://www.siliconmotion.com/download/DWbY/a/PCIe_Gen4_NVMe_FerriSSD_PB_EN.pdf

"SM2268XT PCIe Gen 4 x5 NVMe 2.0 SSD Controller," Product Brief, Silicon Motion, Inc., 2023, https://www.siliconmotion.com/download/3oH/a/SM2268XT_PB_EN.pdf

76. The '825 Accused Products, such as for example the SM681GX*-Bx or SM2268XT PCIe Gen4 x4 NVMe 2.0 SSD controller, comprise a second controller configured to receive the at least one command from the plurality of queues, generate subcommands based on the at least one command, and direct the subcommands to at least one bank of a solid-state storage. For example, as noted above both the SM681GX*-Bx or SM2268XT PCIe Gen4 x4 NVMe 2.0 SSD controller implement NVMe 2.0 which provides that a controller fetches commands from the Submission Queue(s) and process the commands. "NVM Express Revision 2.0 Base Specification," May 13, 2021, at 31. The NVMe 2.0 interface additionally defines a command as being processed when "the controller and/or namespace state is being accessed or modified by the command." *Id*. at 106. A namespace is defined as a formatted quantity of non-volatile memory accessible by a host. A namespace is also associated with an I/O Command Set that operates on that namespace. NVMe 2.0 also provides a common command format that includes a namespace identifier (NSID) which specifies the namespace that the command applies to. Upon information in belief, this processing of commands generates subcommands based on the commands and directs them to at least one bank of the solid-state storage.

A namespace is a formatted quantity of non-volatile memory that may be accessed by a host. Associated with each namespace is an I/O Command Set that operates on that namespace. An NVM Express controller may support multiple namespaces that are referenced using a namespace ID. Namespaces may be created and deleted using the Namespace Management and Capacity Management commands. The Identify Namespace data structure, the I/O Command Set specific Identify Namespace data structure, and the I/O Command Set Independent Identify Namespace data structure indicate capabilities and settings that are specific to a particular namespace.

"NVM Express Revision 2.0 Base Specification," May 13, 2021, at 16.

Figure 87: Common Command Format

Bytes	Description
03:00	**Command Dword 0 (CDW0):** This field is common to all commands and is defined in Figure 86.
07:04	**Namespace Identifier (NSID):** This field specifies the namespace that this command applies to. If the namespace identifier is not used for the command, then this field shall be cleared to 0h. The value FFFFFFFFh in this field is a broadcast value (refer to section 3.2.1.2), where the scope (e.g., the NVM subsystem, all attached namespaces, or all namespaces in the NVM subsystem) is dependent on the command. Refer to Figure 138 and Figure 390 for commands that support the use of the value FFFFFFFFh in this field. Specifying an inactive namespace identifier (refer to section 3.2.1.4) in a command that uses the namespace identifier shall cause the controller to abort the command with a status code of Invalid Field in Command, unless otherwise specified. Specifying an invalid namespace identifier (refer to section 3.2.1.2) in a command that uses the namespace identifier shall cause the controller to abort the command with a status code of Invalid Namespace or Format, unless otherwise specified. If the namespace identifier is used for the command (refer to Figure 138), the value FFFFFFFFh is not supported for that command, and the host specifies a value of FFFFFFFFh, then the controller should abort the command with a status code of Invalid Field in Command, unless otherwise specified. If the namespace identifier is not used for the command and the host specifies a value from 1h to FFFFFFFFh, then the controller should abort the command with a status code of Invalid Field in Command, unless otherwise specified.
11:08	**Command Dword 2 (CDW2):** This field is command specific Dword2.
15:12	**Command Dword 3 (CDW3):** This field is command specific Dword3.

"NVM Express Revision 2.0 Base Specification," May 13, 2021, at 92.

77.   Additionally, the NVMe 2.0 interface supports launching and executing multiple commands from a submission queue in parallel by configuring an Arbitration Burst. "Arbitration burst" is defined as "[t]he maximum number of commands that may be fetched by an arbitration mechanism at one time from a Submission Queue." *Id*. at 7 (1.5.3 arbitration burst).

> In order to make efficient use of the non-volatile memory, it is often advantageous to execute multiple commands from a Submission Queue in parallel. For Submission Queues that are using weighted round robin with urgent priority class or round robin arbitration, host software may configure an Arbitration Burst setting. The Arbitration Burst setting indicates the maximum number of commands that the controller may launch at one time from a particular Submission Queue. It is recommended that host software configure the Arbitration Burst setting as close to the recommended value by the controller as possible (specified in the Recommended Arbitration Burst field of the Identify Controller data structure in Figure 275), taking into consideration any latency requirements. Refer to section 5.27.1.1.

"NVM Express Revision 2.0 Base Specification," May 13, 2021, at 106.

78.   Furthermore, the '825 Accused Products, such as for example the SM2268XT PCIe Gen4 x4 NVMe 2.0 SSD controller, implement the Open NAND Flash Interface (ONFI) 5.0 standardized NAND Flash device interface.

SM2268XT

Host Interface	PCIe Gen4 x4
PCIe Protocol	NVMe 2.0
Processor	Dual-core ARM Cortex R8 CPU
NAND Flash Channel	4
Channel/CE	4CH/16CE
Max Performance	Sequential Read: 7,400 MB/s
	Sequential Write: 6,500 MB/s
	Random Read: 1,200K IOPS
	Random Write: 1,200K IOPS
NAND Flash Support	ONFI 5.0 and Toggle 3.0
	NV-DDR3/NV-LPDDR4 up to 3,200 MT/s
Security	Real time full drive encryption with AES 128/256
	TCG Opal 2.0 compliant
	Hardware SHA 384 and TRNG
	Secure Boot for FW authentication
Package	247-balls FCCSP (7.7mm x 11mm)

"SM2268XT PCIe Gen 4 x5 NVMe 2.0 SSD Controller," Product Brief, Silicon Motion, Inc., 2023, https://www.siliconmotion.com/download/3oH/a/SM2268XT_PB_EN.pdf

79.   The ONFI 5.0 NAND flash interface defines Logical Unit (LUN) as "the minimum unit that can independently execute commands." "Open NAND Flash Interface (ONFI) Specification, Revision 5.0," May 25, 2021, at 88. The ONFI 5.0 NAND flash interface additionally provides generating subcommands based on a command to be executed. *Id*. at 346. For example, with respect to Read Commands, the ONFI 5.0 NAND flash interface discloses that the target must set tLunSelected to the LUN indicated by the row address received [first subcommand], issue the Read Page with address to the LUN selected [second subcommand], and issue a command requesting all other LUNs not selected to turn off their output buffers [third subcommand]; and after corresponding command cycles are received, the command is passed to the LUN selected for execution.

T_RD_AddrWait	tLastCmd set to 00h. Set tbChgCol to TRUE. Set tbChgColEnh to TRUE. If R/B_n is cleared to zero, then tbStatus78hReq is set to TRUE. Wait for an address cycle.		
	1. Address cycle received	→	T_RD_Addr

T_RD_Addr	Store the address cycle received.		
	3. More address cycles required	→	T_RD_AddrWait
	4. All address cycles received	→	T_RD_LUN_Execute

T_RD_LUN_Execute	The target performs the following actions: 1. tLunSelected is set to the LUN indicated by the row address received. 2. Issues the Read Page with address to LUN tLunSelected. 3. Requests all idle LUNs not selected to turn off their output buffers.[1]		
	1. Unconditional	→	T_RD_LUN_Confirm
	NOTE: 1. LUNs not selected will only turn off their output buffers if they are in an Idle state. If other LUNs are active, the host shall issue a Read Status Enhanced (78h) command to ensure all LUNs that are not selected turn off their output buffers prior to issuing the Read (00h) command.		

T_RD_LUN_Confirm	Wait for 30h, 31h, 32h, or 35h to be received.		
	1. Command cycle of 30h, 31h, 32h, or 35h received	→	T_RD_Cmd_Pass

T_RD_Cmd_Pass	Pass command received to LUN tLunSelected		
	1. Command passed was 35h	→	T_RD_Copyback
	2. Command passed was 30h, 31h, or 32h	→	T_Idle_Rd

"Open NAND Flash Interface (ONFI) Specification, Revision 5.0," May 25, 2021, at 346.

80.   The ONFI 5.0 NAND flash interface additionally provides that separate logical unit

(LUNs) "may operate on arbitrary command sequences in parallel."

A logical unit (LUN) is the minimum unit that can independently execute commands and report status. Specifically, separate LUNs may operate on arbitrary command sequences in parallel. For example, it is permissible to start a Page Program operation on LUN 0 and then prior to the operation's completion to start a Read command on LUN 1. See multiple LUN operation restrictions in section 3.1.3. A LUN contains at least one page register and a Flash array. The number of page registers is dependent on the number of multi-plane operations supported for that LUN. The Flash array contains a number of blocks.

"Open NAND Flash Interface (ONFI) Specification, Revision 5.0," May 25, 2021, at 88.

3.1.3. Multiple LUN Operation Restrictions

LUNs are independent entities. A multiple LUN operation is one in which two or more LUNs are simultaneously processing commands. During multiple LUN operations the individual LUNs involved may be in any combination of busy or ready status

When a Page Program command (80h) is issued on any LUN that is not preceded by an 11h command, all idle LUNs may clear their page registers if the program page register clear enhancement is not supported or enabled. Thus, the host should not begin a Page Program command on a LUN while a Read Page operation is either ongoing or has completed but the data has not been read from another LUN, as the contents of the page register for the Read operation are lost. A Read Page can be issued to one LUN while a Page Program is ongoing within a second LUN without any restriction. If the program page register clear enhancement is enabled, this restriction does not apply.

"Open NAND Flash Interface (ONFI) Specification, Revision 5.0," May 25, 2021, at 91.

81.   The '825 Accused Products either comprise a solid-state storage, such as for example the SM681GX*-Bx, or are configured for inclusion in a system including a solid-state storage, such as for example the SM2268XT PCIe Gen4 x4 NVMe 2.0 SSD controller. For example, for the SM681GX*-Bx, the form factor of the solid-state storage media is 20mm × 16mm BGA and the density of the solid-state storage media of SM681GX*-Bx is 120-960GB under 3D TLCmode and 32-320GB under 3D SLCmode.

Specifications

	SM681GX*-Bx
Host Interface	PCIe Gen4 x4 Lane
PCIe Protocal	NVMe 2.0 with NVMe MI Appendix C Specification
Density	120~960GB 3D TLC ; 32~320GB 3D SLCMode
HMB support	DRAM-less with optional HMB
Form Factor	20mm x 16mm BGA
Green Product	Compliant to RoHS (Restriction to Hazardous Substances Directive) 2.0 / Halogen Free
Temperature Support	Commercial (0°C to + 70°C) Industrial (-40°C to + 85°C) Automotive (-40°C to + 105°C)

"PICe Gen4/NVMe Single Chip SSD Bx Series Product Brief," Silicon Motion, Inc., 2023;

Indirect Infringement (Inducement – 35 U.S.C. § 271(b))

82.   In addition and/or in the alternative to its direct infringements, SMI has indirectly infringed and continues to indirectly infringe one or more claims of the '825 Patent by knowingly and intentionally inducing others, including its subsidiaries, distributors, affiliates, retailers, suppliers, integrators, importers, customers, and/or consumers, to directly infringe by making, using, offering to sell, selling and/or importing into the United States the '825 Accused Product.

83.   At a minimum, SMI has knowledge of the '825 Patent since being served with this Complaint. SMI also has knowledge of the '825 Patent since receiving detailed correspondence from UTL prior to the filing of the Complaint, alerting SMI to its infringements. Since receiving notice of its infringements, SMI has actively induced the direct infringements of its subsidiaries, distributors, affiliates, retailers, suppliers, integrators, importers, customers, and/or consumers as set forth under U.S.C. § 271(b). Indeed, SMI has intended to cause, continues to intend to cause, and has taken, and continues to take affirmative steps to induce infringement by, among other things, creating and disseminating advertisements and instructive materials that promote the infringing use of the '825 Accused Products; creating and/or maintaining established distribution channels for the '825 Accused Products into and within the United States; manufacturing the '825 Accused Products in conformity with U.S. laws and regulations; providing technical documentation for the '825 Accused Products, including white papers, product briefs, and descriptions of the features and technologies[3]; promoting the incorporation of the '825 Accused Products into end-user products.

---

[3] *See, e.g.,* https://www.siliconmotion.com/products/client/detail; https://www.siliconmotion.com/products/enterprise/detail; https://www.siliconmotion.com/products/Portable/detail; https://www.siliconmotion.com/products/automotive/detail; https://www.siliconmotion.com/product/Ferri-Embedded-Storage.html; and the product briefs and white papers linked therefrom (last visited May 20, 2023).

Damages

84.   On information and belief, despite having knowledge of the '825 Patent and knowledge that it is directly and/or indirectly infringing one or more claims of the '825 Patent, SMI has nevertheless continued its infringing conduct and disregarded an objectively high likelihood of infringement. SMI's infringing activities relative to the '825 Patent have been, and continue to be, willful, wanton, malicious, in bad-faith, deliberate, consciously wrongful, flagrant, characteristic of a pirate, and an egregious case of misconduct beyond typical infringement such that UTL is entitled to enhanced damages under 35 U.S.C. § 284 up to three times the amount found or assessed.

85.   UTL has been damaged as a result of SMI's infringing conduct described in this Count. SMI is, thus, liable to UTL in an amount that adequately compensates UTL for SMI's infringements, which, by law, cannot be less than a reasonable royalty, together with interest and costs as fixed by this Court under 35 U.S.C. § 284.

COUNT III
(INFRINGEMENT OF U.S. PATENT NO. 11,573,909)

86.   Plaintiff incorporates the preceding paragraphs herein by reference.

87.   This cause of action arises under the patent laws of the United States, and, in particular, 35 U.S.C. §§ 271, *et seq*.

88.   UTL is the owner of all substantial rights, title, and interest in and to the '909 Patent including the right to exclude others and to enforce, sue, and recover damages for past and future infringements.

89.   The '909 Patent is valid, enforceable, and was duly and legally issued by the United States Patent and Trademark Office on February 7, 2023, after full and fair examination.

90.   SMI has and continues to directly and/or indirectly infringe (by inducing infringement) one or more claims of the '909 Patent in this District and elsewhere in Texas and the United States by making, using, selling, offering to sell, and/or importing, and by actively inducing others to make, use, sell, offer to sell, and/or import, SMI products, their components and processes, and/or products containing the same that incorporate the fundamental technologies covered by the '909 Patent, including, but not limited to, the SMI SSD Controllers, including SMI's Client, Enterprise, and Automotive SSD Controllers and FerriSSDs, such as for example the SM2268XT and PCIe Gen4/NVMe Single Chip SSD Bx Series (collectively, the "'909 Accused Products").

Direct Infringement (35 U.S.C. § 271(a))

91.   SMI has directly infringed and continues to directly infringe one or more claims of the'909 Patent in this District and elsewhere in Texas and the United States.

92.   SMI has directly infringed and continues to directly infringe, either by itself or via its agent(s), at least Claim 1 of the '909 Patent as set forth under 35 U.S.C. § 271(a) by making, offering for sale, selling, and/or importing, the '909 Accused Products. Furthermore, SMI makes and sells the '909 Accused Products outside of the United States and either, delivers those products to its customers, distributors, and/or subsidiaries in the United States, or, in the case that it delivers the '909 Accused Products outside of the United States, it does so intending and/or knowing that those products are destined for the United States and/or designed and designated for sale in the United States, thereby directly infringing the '909 Patent. *See, e.g., Lake Cherokee Hard Drive Techs., L.L.C. v. Marvell Semiconductor, Inc.*, 964 F. Supp. 2d 653, 658 (E.D. Tex. 2013). Furthermore, SMI directly infringes the '909 Patent through its direct involvements in, and control of, the activities of its subsidiaries and/or affiliates, including SMI – USA and MaxLinear. Subject

to SMI's direction and control, such subsidiaries and/or affiliates conduct activities that constitute direct infringement of the '909 Patent under 35 U.S.C. § 271(a) by making, offering for sale, selling, and/or importing '909 Accused Products. SMI receives direct financial benefit from such infringements of its U.S.-based subsidiaries and/or affiliates, including SMI – USA and MaxLinear.

93.   By way of illustration only, the '909 Accused Products include each and every element of claim 1 of the '909 Patent. The '909 Accused Products, such as for example the SM2268XT PCIe Gen 4x5 NVMe 2.0 SSD controller or PCIe Gen4/NVMe Single Chip SSD Bx Series (e.g., SM681GX*-Bx), are a system that includes controllers.

"SM2268XT PCIe Gen 4 x5 NVMe 2.0 SSD Controller," Product Brief, Silicon Motion, Inc., 2023, https://www.siliconmotion.com/download/3oH/a/SM2268XT_PB_EN.pdf

SiliconMotion

PCIe NVMe FerriSSD®

Single-Chip SSD

www.siliconmotion.com

PCIe Gen4/NVMe
Single-Chip SSD
Bx Series

The FerriSSD® is designed optimally for a wide range of embedded applications which requires faster access speed, small flexible form factor, and reliable PCIe/NVMe storage. By combining industry proven controller technology, NAND flash and passive components into a small single BGA package, FerriSSD® simplified design efforts, reduces time-to-market white protecting from NAND technology migration concerns.

94.   The '909 Accused Products comprise a first controller that directs at least one command to a plurality of queues, wherein the at least one command is separated into the plurality of queues based on a command type of each command of the at least one command, and the plurality of queues comprises a first queue configured to store management commands and a second queue configured to store other commands, For example, the SM681GX*-Bx and SM2268XT PCIe Gen4 x4 NVMe 2.0 SSD controller implement the NVM Express (NVMe) 2.0 interface that "allows host software to communicate with a non-volatile memory subsystem." See "NVM Express Revision 2.0 Base Specification," May 13, 2021, at 2.

Specifications

SM681GX*-Bx

"SM2268XT PCIe Gen 4 x5 NVMe 2.0 SSD Controller," Product Brief, Silicon Motion, Inc., 2023, https://www.siliconmotion.com/download/3oH/a/SM2268XT_PB_EN.pdf

95.   The NVMe 2.0 interface provides that the host software submits commands to the controller which can be directed to one or more Submission Queues in the Controller Memory Buffer that allows the host to write the entire submission queue entry (command) to the controller's internal memory space thus avoiding one read from the controller to the host.

When using a memory-based transport implementation (e.g. PCIe), host software submits commands to a controller through pre-allocated Submission Queues. A controller is alerted to newly submitted commands through SQ Tail Doorbell register writes. The difference between the previous doorbell register value and the current register write indicates the number of commands that were submitted.

A controller fetches commands from the Submission Queue(s) and processes them. Except for fused operations, there are no ordering restrictions for processing of commands within or across Submission Queues. Host software should not submit commands to a Submission Queue that may not be re-ordered arbitrarily. Data associated with the processing of a command may or may not be committed to the NVM subsystem non-volatile memory storage medium in the order that commands are submitted.

"NVM Express Revision 2.0 Base Specification," May 13, 2021, at 31.

Submission Queues in host memory require the controller to perform a PCI Express read from host memory in order to fetch the submission queue entries. Submission Queues in controller memory enable host software to directly write the entire submission queue entry to the controller's internal memory space, avoiding one read from the controller to the host. This approach reduces latency in command execution and improves efficiency in a PCI Express fabric topology that may include multiple switches. Similarly, PRP Lists or SGLs require separate fetches across the PCI Express fabric, which may be avoided by writing the PRP or SGL to the Controller Memory Buffer. Completion Queues in the Controller Memory Buffer may be used for peer to peer or other applications. For writes of small amounts of data, it may be advantageous to have the host write the data and/or metadata to the Controller Memory Buffer rather than have the controller fetch it from host memory.

"NVM Express Revision 2.0 Base Specification," May 13, 2021, at 350.

96.   The submission queues in the Controller Memory Buffer include at least I/O Submission Queue (used to submit I/O commands such as Read and Write commands id. at 9) and Admin Submission Queues (used to submit administrative commands id. at 6); see also id. at 8 (1.5.14 Controller ". . . All controllers implement one Admin Submission Queue and one Admin Completion Queue. Depending on the controller type, a controller may also implement one or more I/O Submission Queues and I/O Completion Queues."); id. at 9 (1.5.33 I/O Submission Queue).

Figure 160: Create I/O Submission Queue – Command Dword 11

Bits	Description
00	**Physically Contiguous (PC):** If set to '1', then the Submission Queue is physically contiguous and PRP Entry 1 (PRP1) is the address of a contiguous physical buffer. If cleared to '0', then the Submission Queue is not physically contiguous and PRP Entry 1 (PRP1) is a PRP List pointer. If this bit is cleared to '0' and CAP.CQR is set to '1', then the controller should return an error of Invalid Field in Command. If the: • queue is located in the Controller Memory Buffer; • PC is cleared to '0'; and • CMBLOC.CQPDS is cleared to '0', then the controller shall abort the command with Invalid Use of Controller Memory Buffer status.

"NVM Express Revision 2.0 Base Specification," May 13, 2021, at 158.

Support for Sanitize commands in a Controller Memory Buffer (i.e., submitted to an Admin Submission Queue in a Controller Memory Buffer or specifying an Admin Completion Queue in a Controller Memory Buffer) is implementation specific. If an implementation does not support Sanitize commands in a Controller Memory Buffer and a controller's Admin Submission Queue or Admin Completion Queue is in the Controller Memory Buffer, then the controller shall abort all Sanitize commands with a status code of Command Not Supported for Queue in CMB.

"NVM Express Revision 2.0 Base Specification," May 13, 2021, at 283.

97.   The '909 Accused Products, such as for example the SM681GX*-Bx or SM2268XT PCIe Gen4 x4 NVMe 2.0 SSD controller, comprise a second controller configured to receive the at least one command from the plurality of queues, generate subcommands based on the at least one command, and direct the subcommands to at least one bank of a solid-state storage.

98.   For example, as noted above both the SM681GX*-Bx or SM2268XT PCIe Gen4 x4 NVMe 2.0 SSD controller implement NVMe 2.0 which provides that a controller fetches commands from the Submission Queue(s) and process the commands. "NVM Express Revision 2.0 Base Specification," May 13, 2021, at 31. The NVMe 2.0 interface additionally defines a command as being processed when "the controller and/or namespace state is being accessed or modified by the command." *Id*. at 106. A namespace is defined as a formatted quantity of non-volatile memory accessible by a host. A namespace is also associated with an I/O Command Set that operates on that namespace. NVMe 2.0 also provides a common command format that includes a namespace identifier (NSID) which specifies the namespace that the command applies to. Upon information in belief, this processing of commands generates subcommands based on the commands and directs them to at least one bank of the solid-state storage.

A namespace is a formatted quantity of non-volatile memory that may be accessed by a host. Associated with each namespace is an I/O Command Set that operates on that namespace. An NVM Express controller may support multiple namespaces that are referenced using a namespace ID. Namespaces may be created and deleted using the Namespace Management and Capacity Management commands. The Identify Namespace data structure, the I/O Command Set specific Identify Namespace data structure, and the I/O Command Set Independent Identify Namespace data structure indicate capabilities and settings that are specific to a particular namespace.

"NVM Express Revision 2.0 Base Specification," May 13, 2021, at 16.

Figure 87: Common Command Format

Bytes	Description
03:00	**Command Dword 0 (CDW0):** This field is common to all commands and is defined in Figure 86.
07:04	**Namespace Identifier (NSID):** This field specifies the namespace that this command applies to. If the namespace identifier is not used for the command, then this field shall be cleared to 0h. The value FFFFFFFFh in this field is a broadcast value (refer to section 3.2.1.2), where the scope (e.g., the NVM subsystem, all attached namespaces, or all namespaces in the NVM subsystem) is dependent on the command. Refer to Figure 138 and Figure 390 for commands that support the use of the value FFFFFFFFh in this field. Specifying an inactive namespace identifier (refer to section 3.2.1.4) in a command that uses the namespace identifier shall cause the controller to abort the command with a status code of Invalid Field in Command, unless otherwise specified. Specifying an invalid namespace identifier (refer to section 3.2.1.2) in a command that uses the namespace identifier shall cause the controller to abort the command with a status code of Invalid Namespace or Format, unless otherwise specified. If the namespace identifier is used for the command (refer to Figure 138), the value FFFFFFFFh is not supported for that command, and the host specifies a value of FFFFFFFFh, then the controller should abort the command with a status code of Invalid Field in Command, unless otherwise specified. If the namespace identifier is not used for the command and the host specifies a value from 1h to FFFFFFFFh, then the controller should abort the command with a status code of Invalid Field in Command, unless otherwise specified.
11:08	**Command Dword 2 (CDW2):** This field is command specific Dword2.
15:12	**Command Dword 3 (CDW3):** This field is command specific Dword3.

"NVM Express Revision 2.0 Base Specification," May 13, 2021, at 92.

99.   Additionally, the NVMe 2.0 interface supports launching and executing multiple commands from a submission queue in parallel by configuring an Arbitration Burst. "Arbitration burst" is defined as "[t]he maximum number of commands that may be fetched by an arbitration mechanism at one time from a Submission Queue." *Id*. at 7 (1.5.3 arbitration burst).

> In order to make efficient use of the non-volatile memory, it is often advantageous to execute multiple commands from a Submission Queue in parallel. For Submission Queues that are using weighted round robin with urgent priority class or round robin arbitration, host software may configure an Arbitration Burst setting. The Arbitration Burst setting indicates the maximum number of commands that the controller may launch at one time from a particular Submission Queue. It is recommended that host software configure the Arbitration Burst setting as close to the recommended value by the controller as possible (specified in the Recommended Arbitration Burst field of the Identify Controller data structure in Figure 275), taking into consideration any latency requirements. Refer to section 5.27.1.1.

"NVM Express Revision 2.0 Base Specification," May 13, 2021, at 106.

100.   Furthermore, the '909 Accused Products, such as for example the SM2268XT PCIe Gen4 x4 NVMe 2.0 SSD controller, implement the Open NAND Flash Interface (ONFI) 5.0 standardized NAND Flash device interface.

SM2268XT

Host Interface	PCIe Gen4 x4
PCIe Protocol	NVMe 2.0
Processor	Dual-core ARM Cortex R8 CPU
NAND Flash Channel	4
Channel/CE	4CH/16CE
Max Performance	Sequential Read: 7,400 MB/s
	Sequential Write: 6,500 MB/s
	Random Read: 1,200K IOPS
	Random Write: 1,200K IOPS
NAND Flash Support	ONFI 5.0 and Toggle 3.0
	NV-DDR3/NV-LPDDR4 up to 3,200 MT/s
Security	Real time full drive encryption with AES 128/256
	TCG Opal 2.0 compliant
	Hardware SHA 384 and TRNG
	Secure Boot for FW authentication
Package	247-balls FCCSP (7.7mm x 11mm)

"SM2268XT PCIe Gen 4 x5 NVMe 2.0 SSD Controller," Product Brief, Silicon Motion, Inc., 2023, https://www.siliconmotion.com/download/3oH/a/SM2268XT_PB_EN.pdf

101. The ONFI 5.0 NAND flash interface defines Logical Unit (LUN) as "the minimum unit that can independently execute commands." "Open NAND Flash Interface (ONFI) Specification, Revision 5.0," May 25, 2021, at 88. The ONFI 5.0 NAND flash interface additionally provides generating subcommands based on a command to be executed. Id. at 346. For example, with respect to Read Commands, the ONFI 5.0 NAND flash interface discloses that the target must set tLunSelected to the LUN indicated by the row address received [first subcommand], issue the Read Page with address to the LUN selected [second subcommand], and issue a command requesting all other LUNs not selected to turn off their output buffers [third subcommand]; and after corresponding command cycles are received, the command is passed to the LUN selected for execution.

T_RD_AddrWait	tLastCmd set to 00h. Set tbChgCol to TRUE. Set tbChgColEnh to TRUE. If R/B_n is cleared to zero, then tbStatus78hReq is set to TRUE. Wait for an address cycle.		
	1. Address cycle received	→	T_RD_Addr

T_RD_Addr	Store the address cycle received.		
	3. More address cycles required	→	T_RD_AddrWait
	4. All address cycles received	→	T_RD_LUN_Execute

T_RD_LUN_Execute	The target performs the following actions: 1. tLunSelected is set to the LUN indicated by the row address received. 2. Issues the Read Page with address to LUN tLunSelected. 3. Requests all idle LUNs not selected to turn off their output buffers.[1]		
	1. Unconditional	→	T_RD_LUN_Confirm
	NOTE: 1. LUNs not selected will only turn off their output buffers if they are in an Idle state. If other LUNs are active, the host shall issue a Read Status Enhanced (78h) command to ensure all LUNs that are not selected turn off their output buffers prior to issuing the Read (00h) command.		

T_RD_LUN_Confirm	Wait for 30h, 31h, 32h, or 35h to be received.		
	1. Command cycle of 30h, 31h, 32h, or 35h received	→	T_RD_Cmd_Pass

T_RD_Cmd_Pass	Pass command received to LUN tLunSelected		
	1. Command passed was 35h	→	T_RD_Copyback
	2. Command passed was 30h, 31h, or 32h	→	T_Idle_Rd

"Open NAND Flash Interface (ONFI) Specification, Revision 5.0," May 25, 2021, at 346.

102.   The ONFI 5.0 NAND flash interface additionally provides that separate logical unit

(LUNs) "may operate on arbitrary command sequences in parallel."

A logical unit (LUN) is the minimum unit that can independently execute commands and report status. Specifically, separate LUNs may operate on arbitrary command sequences in parallel. For example, it is permissible to start a Page Program operation on LUN 0 and then prior to the operation's completion to start a Read command on LUN 1. See multiple LUN operation restrictions in section 3.1.3. A LUN contains at least one page register and a Flash array. The number of page registers is dependent on the number of multi-plane operations supported for that LUN. The Flash array contains a number of blocks.

"Open NAND Flash Interface (ONFI) Specification, Revision 5.0," May 25, 2021, at 88.

3.1.3. Multiple LUN Operation Restrictions

LUNs are independent entities. A multiple LUN operation is one in which two or more LUNs are simultaneously processing commands. During multiple LUN operations the individual LUNs involved may be in any combination of busy or ready status

When a Page Program command (80h) is issued on any LUN that is not preceded by an 11h command, all idle LUNs may clear their page registers if the program page register clear enhancement is not supported or enabled. Thus, the host should not begin a Page Program command on a LUN while a Read Page operation is either ongoing or has completed but the data has not been read from another LUN, as the contents of the page register for the Read operation are lost. A Read Page can be issued to one LUN while a Page Program is ongoing within a second LUN without any restriction. If the program page register clear enhancement is enabled, this restriction does not apply.

"Open NAND Flash Interface (ONFI) Specification, Revision 5.0," May 25, 2021, at 91.

Indirect Infringement (Inducement – 35 U.S.C. § 271(b))

103.   In addition and/or in the alternative to its direct infringements, SMI has indirectly infringed and continues to indirectly infringe one or more claims of the '909 Patent by knowingly and intentionally inducing others, including its subsidiaries, distributors, affiliates, retailers, suppliers, integrators, importers, customers, and/or consumers, to directly infringe by making, using, offering to sell, selling and/or importing into the United States the '909 Accused Products.

104.   At a minimum, SMI has knowledge of the '909 Patent since being served with this Complaint. SMI also has knowledge of the '909 Patent since receiving detailed correspondence from UTL prior to the filing of the Complaint, alerting SMI to its infringements. Since receiving notice of its infringements, SMI has actively induced the direct infringements of its subsidiaries, distributors, affiliates, retailers, suppliers, integrators, importers, customers, and/or consumers as set forth under U.S.C. § 271(b). Indeed, SMI has intended to cause, continues to intend to cause, and has taken, and continues to take affirmative steps to induce infringement by, among other things, creating and disseminating advertisements and instructive materials that promote the infringing use of the '909 Accused Products; creating and/or maintaining established distribution channels for the '909 Accused Products into and within the United States; manufacturing the '909

Accused Products in conformity with U.S. laws and regulations; providing technical documentation for the '909 Accused Products, including white papers, product briefs, and descriptions of the features and technologies[4]; promoting the incorporation of the '909 Accused Products into end-user products.

Damages

105.   On information and belief, despite having knowledge of the '909 Patent and knowledge that it is directly and/or indirectly infringing one or more claims of the '909 Patent, SMI has nevertheless continued its infringing conduct and disregarded an objectively high likelihood of infringement. SMI's infringing activities relative to the '909 Patent have been, and continue to be, willful, wanton, malicious, in bad-faith, deliberate, consciously wrongful, flagrant, characteristic of a pirate, and an egregious case of misconduct beyond typical infringement such that UTL is entitled to enhanced damages under 35 U.S.C. § 284 up to three times the amount found or assessed.

106.   UTL has been damaged as a result of SMI's infringing conduct described in this Count. SMI is, thus, liable to UTL in an amount that adequately compensates UTL for SMI's infringements, which, by law, cannot be less than a reasonable royalty, together with interest and costs as fixed by this Court under 35 U.S.C. § 284.

COUNT IV

(INFRINGEMENT OF U.S. PATENT NO. 11,640,359)

107.   Plaintiff incorporates the preceding paragraphs herein by reference.

---

[4] *See, e.g.*, https://www.siliconmotion.com/products/client/detail; https://www.siliconmotion.com/products/enterprise/detail; https://www.siliconmotion.com/products/Portable/detail; https://www.siliconmotion.com/products/automotive/detail; https://www.siliconmotion.com/product/Ferri-Embedded-Storage.html; and the product briefs and white papers linked therefrom (last visited May 20, 2023).

108.   This cause of action arises under the patent laws of the United States, and, in particular, 35 U.S.C. §§ 271, *et seq*.

109.   UTL is the owner of all substantial rights, title, and interest in and to the '359 Patent including the right to exclude others and to enforce, sue, and recover damages for past and future infringements.

110.   The '359 Patent is valid, enforceable, and was duly and legally issued by the United States Patent and Trademark Office on May 2, 2023, after full and fair examination.

111.   SMI has and continues to directly and/or indirectly infringe (by inducing infringement) one or more claims of the '359 Patent in this District and elsewhere in Texas and the United States by making, using, selling, offering to sell, and/or importing, and by actively inducing others to make, use, sell, offer to sell, and/or import, SMI products, their components and processes, and/or products containing the same that incorporate the fundamental technologies covered by the '359 Patent, including, but not limited to, the SMI SSD Controllers, including SMI's Client, Enterprise, and Automotive SSD Controllers and FerriSSDs, such as for example the SM2268XT and PCIe Gen4/NVMe Single Chip SSD Bx Series (collectively, the "'359 Accused Products").

Direct Infringement (35 U.S.C. § 271(a))

112.   SMI has directly infringed and continues to directly infringe one or more claims of the'359 Patent in this District and elsewhere in Texas and the United States.

113.   SMI has directly infringed and continues to directly infringe, either by itself or via its agent(s), at least Claim 1 of the '359 Patent as set forth under 35 U.S.C. § 271(a) by making, offering for sale, selling, and/or importing, the '359 Accused Products. Furthermore, SMI makes and sells the '359 Accused Products outside of the United States and either, delivers those products

to its customers, distributors, and/or subsidiaries in the United States, or, in the case that it delivers

the '359 Accused Products outside of the United States, it does so intending and/or knowing that

those products are destined for the United States and/or designed and designated for sale in the

United States, thereby directly infringing the '359 Patent. *See, e.g., Lake Cherokee Hard Drive*

Techs., L.L.C. v. Marvell Semiconductor, Inc., 964 F. Supp. 2d 653, 658 (E.D. Tex. 2013).

Furthermore, SMI directly infringes the '359 Patent through its direct involvements in, and control

of, the activities of its subsidiaries and/or affiliates, including SMI – USA and MaxLinear. Subject

to SMI's direction and control, such subsidiaries and/or affiliates conduct activities that constitute

direct infringement of the '359 Patent under 35 U.S.C. § 271(a) by making, offering for sale,

selling, and/or importing '359 Accused Products. SMI receives direct financial benefit from such

infringements of its U.S.-based subsidiaries and/or affiliates, including SMI – USA and

MaxLinear.

114.   By way of illustration only, the '359 Accused Products include each and every

element of claim 1 of the '359 Patent. As shown below, the '359 Accused Products perform a

method for managing data in a NAND flash storage system in accordance with the requirements

of claim 1. Further, SMI directs or controls each step discussed below by including instructions

and directives, such as firmware and source code, in the Accused Products that cause this to occur.

For example, SMI's SM2268XT PCIe Gen 4x5 NVMe 2.0 SSD controller performs such a

method:

SiliconMotion

SM2268XT

High Performance with Low Power
PCIe Gen4 x4 NVMe 2.0 SSD Controller

SM2268XT

The new-generation SM2268XT provides an optimal balance of performance, power efficiency, and reliability making it an ideal solution for meeting the customer need for faster data access and higher throughput.

Ultra-High Performance
By implementing the newer System Architecture and Host Memory Buffer (HMB) function, the SM2268XT controller is optimally designed for DRAM-less SSD applications. The PCIe Gen 4 interface provides 16GT/s x4 lanes bandwidth, coupled with four NAND flash channels of up to 3,200 MT/s data rate per channel. The new SM2268XT delivers sequential read speeds of 7,400 MB/s which is 45% faster than previous one. Random read/write speeds are also improved by 33% to 1,200K IOPs for accelerated operations.

"SM2268XT PCIe Gen 4 x5 NVMe 2.0 SSD Controller," Product Brief, Silicon Motion, Inc., 2023, https://www.siliconmotion.com/download/3oH/a/SM2268XT_PB_EN.pdf

115. The '359 Accused Products comprise circuitry implementing a method to receive an empty-block directive from a host at a storage controller in the NAND flash storage system, the empty-block directive including a logical identifier associated with a physical storage location comprising data that does not need to be preserved. For example, the SM2268XT PCIe Gen4 x5 NVMe 2.0 SSD controller implements the NVM Express (NVMe) 2.0 interface that "allows host software to communicate with a non-volatile memory subsystem." See "NVM Express Revision 2.0 Base Specification," May 13, 2021, at 2. The NVM Express NVM Command Set Specification "defines a specific NVMe I/O Command Set, the NVM Command Set, which extends the NVM Express Base Specification." "NVM Command Set Specification, Revision 1.0c," October 3, 2022, at 2.

116. The NVM Command Set Specification provides that "[a] logic Block may be marked deallocated as a result of a Dataset Management Command . . . a Write Zeroes command

50

addressing the logical block; or a sanitize operation." *Id*. at 10-11. The Dataset Management

Command can be used by the host to indicate a range of logical blocks are deallocated. *Id*. at 28-

29.

Figure 40: Dataset Management – Command Dword 11

Bit	Description
02	**Attribute – Deallocate (AD):** If set to '1', then the NVM subsystem may deallocate all provided ranges. The data returned for logical blocks that were deallocated is specified in section 3.2.3.2.1. The data and metadata for logical blocks that are not deallocated by the NVM subsystem are not changed as the result of a Dataset Management command.
01	**Attribute – Integral Dataset for Write (IDW):** If set to '1', then the dataset should be optimized for write access as an integral unit. The host expects to perform operations on all ranges provided as an integral unit for writes, indicating that if a portion of the dataset is written it is expected that all of the ranges in the dataset are going to be written.
00	**Attribute – Integral Dataset for Read (IDR):** If set to '1', then the dataset should be optimized for read access as an integral unit. The host expects to perform operations on all ranges provided as an integral unit for reads, indicating that if a portion of the dataset is read it is expected that all of the ranges in the dataset are going to be read.

"NVM Command Set Specification, Revision 1.0c," October 3, 2022, at 29.

117.   NVMe provides that the Dataset Management command can be used to indicate a

range of logical blocks are deallocated using PRP Entries 1 and 2 or SGL Entry 1. *Id*. at 28.

3.2.3   Dataset Management command

The Dataset Management command is used by the host to indicate attributes for ranges of logical blocks. This includes attributes like frequency that data is read or written, access size, and other information that may be used to optimize performance and reliability. This command is advisory; a compliant controller may choose to take no action based on information provided.

The command uses Command Dword 10, and Command Dword 11 fields. If the command uses PRPs for the data transfer, then the PRP Entry 1 and PRP Entry 2 fields are used. If the command uses SGLs for the data transfer, then the SGL Entry 1 field is used. All other command specific fields are reserved.

Figure 38: Dataset Management – Data Pointer

Bits	Description
127:00	**Data Pointer (DPTR):** This field specifies the data to use for the command. Refer to the Common Command Format figure in the NVM Express Base Specification for the definition of this field.

"NVM Command Set Specification, Revision 1.0c," October 3, 2022, at 28.

118.   NVMe interface provides that the physical memory locations in memory the

commands use are specified using Physical Region Page (PRP) entries or Scatter Gather Lists

(SGL). "NVM Express Revision 2.0 Base Specification," May 13, 2021, at 30.

39:24		**Data Pointer (DPTR):** This field specifies the data used in the command. If CDW0.PSDT is cleared to 00b, then the definition of this field is:

	39:32	**PRP Entry 2 (PRP2):** This field:
		• is reserved if the data transfer does not cross a memory page boundary;
		• specifies the Page Base Address of the second memory page if the data transfer crosses exactly one memory page boundary. E.g.,:
		   o the command data transfer length is equal in size to one memory page and the offset portion of the PBAO field of PRP1 is non-zero; or
		   o the Offset portion of the PBAO field of PRP1 is equal to 0h and the command data transfer length is greater than one memory page and less than or equal to two memory pages in size;
		and
		• is a PRP List pointer if the data transfer crosses more than one memory page boundary. E.g.,:
		   o the command data transfer length is greater than or equal to two memory pages in size but the offset portion of the PBAO field of PRP1 is non-zero; or
		   o the command data transfer length is equal in size to more than two memory pages and the Offset portion of the PBAO field of PRP1 is equal to 0h.

	31:24	**PRP Entry 1 (PRP1):** This field contains the first PRP entry for the command or a PRP List pointer depending on the command.
		If CDW0.PSDT is set to 01b or 10b, then the definition of this field is:
	39:24	**SGL Entry 1 (SGL1):** This field contains the first SGL segment for the command. If the SGL segment is an SGL Data Block or Keyed SGL Data Block or Transport SGL Data Block descriptor, then it describes the entire data transfer. If more than one SGL segment is needed to describe the data transfer, then the first SGL segment is a Segment, or Last Segment descriptor. Refer to section 4.1.2 for the definition of SGL segments and descriptor types. The NVMe Transport may support a subset of SGL Descriptor types and features as defined in the NVMe Transport binding specification.

"NVM Express Revision 2.0 Base Specification," May 13, 2021, at 105

119.   The '369 Accused Products comprise circuitry implementing a method to return by the storage controller an indication that the logical identifier is empty, in response to a read command from the host requesting to read the data identified by the logical identifier included in the empty-block directive, wherein the data in the physical storage location remains on the NAND flash storage system.

120.   For example, as noted above the SM2268XT PCIe Gen4 x5 NVMe 2.0 SSD controller implements NVMe 2.0 which provides that the completion queue entries indicate a Status Code Type for the type of completion being reported. "NVM Command Set Specification, Revision 1.0c," October 3, 2022, at 19.

Figure 17: Status Code – Media and Data Integrity Error Values

Value	Description
85h	**Compare Failure:** The command failed due to a miscompare during a Compare command.
87h	**Deallocated or Unwritten Logical Block:** The command failed due to an attempt to copy from, read from, or verify an LBA range containing a deallocated or unwritten logical block.

NVM Command Set Specification, Revision 1.0c," October 3, 2022, at 19.

121.   NVMe interface provides that, in response to a command reading deallocated blocks, the controller shall either (1) abort the command and return a status of Deallocated Logical Block using the Error Recovery feature; or (2) return deterministic value of the deallocated block back to the host. *Id*. at 32.

> Using the Error Recovery feature (refer to section 4.1.3.2), host software may select the behavior of the controller when reading deallocated or unwritten blocks. The controller shall abort Copy, Read, Verify, or Compare commands that include deallocated or unwritten blocks with a status of Deallocated or Unwritten Logical Block if that error has been enabled using the DULBE bit in the Error Recovery feature. If the Deallocated or Unwritten Logical error is not enabled, the values read from a deallocated or unwritten block and its metadata (excluding protection information) shall be:
>
> - all bytes cleared to 0h if bits 2:0 in the DLFEAT field are set to 001b;
> - all bytes set to FFh if bits 2:0 in the DLFEAT field are set to 010b; or
> - either all bytes cleared to 0h or all bytes set to FFh if bits 2:0 in the DLFEAT field are cleared to 000b.
>
> The value read from a deallocated logical block shall be deterministic; specifically, the value returned by subsequent reads of that logical block shall be the same until a write operation occurs to that logical block. A deallocated or unwritten block is no longer deallocated or unwritten when the logical block is written. Read operations and Verify operations do not affect the deallocation status of a logical block.

NVM Command Set Specification, Revision 1.0c," October 3, 2022, at 32.

122.   The '369 Accused Products comprise circuitry implementing a method to maintain by the storage controller an index of mappings between the logical identifier and the physical storage location. For example, as noted above the SM2268XT PCIe Gen4 x5 NVMe 2.0 SSD controller implements NVMe 2.0 which provides that "[a] logic Block may be marked deallocated as a result of a Dataset Management Command . . . ." *See, e.g., id*. at 10-11. These Dataset Management commands can be used to indicate a range of logical blocks are deallocated using PRP Entries 1 and 2 or SGL Entry 1, indicating that the controller maintains an index of mappings between the logical identifier and the physical storage location. *Id*. at 28.

53

123. The '369 Accused Products comprise circuitry implementing a method to update the index of mappings by the storage controller, in response to the empty-block directive, to indicate that the data in the physical storage location does not need to be preserved. For example, as noted above the SM2268XT PCIe Gen4 x5 NVMe 2.0 SSD controller implements NVMe 2.0 which provides that "[a] logic Block may be marked deallocated as a result of a Dataset Management Command . . . ." *See, e.g., id.* at 10-11. In response to a command to read deallocated blocks, the controller shall either (1) abort the command and return a status of Deallocated Logical Block using the Error Recovery feature; or (2) return deterministic value of the deallocated block back to the host as one example of an indication that the data in the physical storage location does not need to be preserved. *Id*. at 32.

Indirect Infringement (Inducement – 35 U.S.C. § 271(b))

124. In addition and/or in the alternative to its direct infringements, SMI has indirectly infringed and continues to indirectly infringe one or more claims of the '359 Patent by knowingly and intentionally inducing others, including its subsidiaries, distributors, affiliates, retailers, suppliers, integrators, importers, customers, and/or consumers, to directly infringe by making, using, offering to sell, selling and/or importing into the United States the '359 Accused Product.

125. At a minimum, SMI has knowledge of the '359 Patent since being served with this Complaint. SMI also has knowledge of the '359 Patent since receiving detailed correspondence from UTL prior to the filing of the Complaint, alerting SMI to its infringements. Since receiving notice of its infringements, SMI has actively induced the direct infringements of its subsidiaries, distributors, affiliates, retailers, suppliers, integrators, importers, customers, and/or consumers as set forth under U.S.C. § 271(b). Indeed, SMI has intended to cause, continues to intend to cause, and has taken, and continues to take affirmative steps to induce infringement by, among other

54

things, creating and disseminating advertisements and instructive materials that promote the infringing use of the '359 Accused Products; creating and/or maintaining established distribution channels for the '359 Accused Products into and within the United States; manufacturing the '359 Accused Products in conformity with U.S. laws and regulations; providing technical documentation for the '359 Accused Products, including white papers, product briefs, and descriptions of the features and technologies [5]; promoting the incorporation of the '359 Accused Products into end-user products.

Damages

126.   On information and belief, despite having knowledge of the '359 Patent and knowledge that it is directly and/or indirectly infringing one or more claims of the '359 Patent, SMI has nevertheless continued its infringing conduct and disregarded an objectively high likelihood of infringement. SMI's infringing activities relative to the '359 Patent have been, and continue to be, willful, wanton, malicious, in bad-faith, deliberate, consciously wrongful, flagrant, characteristic of a pirate, and an egregious case of misconduct beyond typical infringement such that UTL is entitled to enhanced damages under 35 U.S.C. § 284 up to three times the amount found or assessed.

127.   UTL has been damaged as a result of SMI's infringing conduct described in this Count. SMI is, thus, liable to UTL in an amount that adequately compensates UTL for SMI's infringements, which, by law, cannot be less than a reasonable royalty, together with interest and costs as fixed by this Court under 35 U.S.C. § 284.

---

[5] *See, e.g.*, https://www.siliconmotion.com/products/client/detail; https://www.siliconmotion.com/products/enterprise/detail; https://www.siliconmotion.com/products/Portable/detail; https://www.siliconmotion.com/products/automotive/detail; https://www.siliconmotion.com/product/Ferri-Embedded-Storage.html; and the product briefs and white papers linked therefrom (last visited May 20, 2023).

CONCLUSION

128.   UTL is entitled to recover from SMI the damages sustained by UTL as a result of

SMI's wrongful acts, and willful infringements, in an amount subject to proof at trial, which, by

law, cannot be less than a reasonable royalty, together with interest and costs as fixed by this Court.

129.   UTL has incurred and will incur attorneys' fees, costs, and expenses in the

prosecution of this action. The circumstances of this dispute may give rise to an exceptional case

within the meaning of 35 U.S.C. § 285, and UTL is entitled to recover its reasonable and necessary

attorneys' fees, costs, and expenses.

JURY DEMAND

130.   UTL hereby requests a trial by jury pursuant to Rule 38 of the Federal Rules of

Civil Procedure.

PRAYER FOR RELIEF

131.   UTL respectfully requests that the Court find in its favor and against SMI, and that the Court grant UTL the following relief:

(i)   A judgment that one or more claims of the Asserted Patents have been infringed, either literally and/or under the doctrine of equivalents, by SMI;

(ii)   A judgment that one or more claims of the Asserted Patents have been willfully infringed, either literally and/or under the doctrine of equivalents, by SMI;

(iii)   A judgment that SMI account for and pay to UTL all damages and costs incurred by Plaintiff because of SMI's infringing activities and other conduct complained of herein, including an accounting for any sales or damages not presented at trial;

(iv)   A judgment that SMI account for and pay to UTL a reasonable, ongoing, post judgment royalty because of SMI's infringing activities, including continuing infringing activities, and other conduct complained of herein;

(v)   A judgment that UTL be granted pre-judgment and post judgment interest on the damages caused by SMI's infringing activities and other conduct complained of herein;

(vi)   A judgment that this case is exceptional under the provisions of 35 U.S.C. § 285 and award enhanced damages; and

(vii)   Such other and further relief as the Court deems just and equitable.
